Recording Guide / Final Submission Checklist

This package is prepared so your group only needs to rehearse, run Python, record, and submit.

Before pressing Record

1. Unzip the complete package into one folder; leave both CSV input files next to the Python script.

2. Install Python 3 if needed. In Windows Command Prompt, use `python --version`, then test `python TSP_Greedy_Implementation.py`. If the Python launcher is configured instead, use `py TSP_Greedy_Implementation.py`.

3. Open **TSP_Greedy_Presentation.pptx**. Keep a terminal window with the project folder ready. Set the terminal font to at least 18 points or zoom in so the output remains readable.

4. Assign one or more narrators. Read the corresponding numbered sections in **TSP_Presentation_Script.pdf**. The entire recording must remain between 10 and 15 minutes.

Suggested recording sequence

• Slides 1–9: introduce the problem, describe the locations, show the graph/matrix, and explain the Greedy algorithm and the Python structure.

• Slide 10: switch from PowerPoint to your terminal without stopping the screen recording. Show the data files exist; type and execute `python TSP_Greedy_Implementation.py`. Scroll through the live result slowly enough to read it.

• Slides 11–14: return to the presentation and discuss tour validation, optional audit, complexity, limitations, conclusion and sources.

Google Maps demonstration (optional, useful for location verification)

Open the hyperlink on the references slide or the URL in **Google_Maps_Route_URL.txt**. It provides a walking-directions preview between the selected locations. **Do not call its on-screen walking distance 3.937 km**; Google Maps route data are different from the Haversine model.

Required submissions

1. Screen-recorded video, 10–15 minutes, including actual execution of the Python program.

2. Runnable source file: **TSP_Greedy_Implementation.py**.

3. Dataset: **TSP_Locations.csv** and **TSP_Distance_Matrix.csv** (and ideally **TSP_Distance_Edges.csv**).

4. Sources and references must appear in the video/slides. The PowerPoint itself is provided for ease of recording, though not separately named in the original handout as a required submission.

Final checks

Confirm all slide numbers match the script; show the whole output; use English narration; say "straight-line model" when stating distance; do not claim Greedy is globally optimal for every dataset; use the actual script

and matrix supplied.
